

Tray Sealer

Intermittent Motion or Continuous Motion Tray Sealing

Originally designed to be used as an off-line tray sealer for reworking of trays at the end of high speed entree lines, it can be configured as a continuous motion machine for low to medium volume production.

An extended infeed section can be added to allow the machine to be hand loaded for a continuous motion operation. Improved throughput can be achieved with the addition of an automated product infeed.

- 30 trays/minute manual feed
60 trays/minute continuous
- High wattage heated roller for cold room operation and rapid recovery
- Carriers available in aluminum, Delrin, or customer specified material
- Small footprint- 89" long x 37" wide x 53" tall
- Improved operator safety when compared with hand operated tray sealing
